

RFIs & Submittals

Focus first on RFIs and submittals by what will actually delay your project

SmartPM reads your open RFIs and submittals against your schedule and ranks them by when they hit the work and how close they are on the critical path. Data flows in automatically from Forma Build and Forma Data Management, part of the Autodesk Forma® industry cloud, and a purpose-built AI agent links each item to the specific activities it threatens - so the ones that matter stop hiding in a flat list.

Ranked by Impact, Not by Date Opened

Prioritized Visibility

See how many days each item can sit before it moves the schedule, how much float is left, which items are critical right now, and whose desk it's on.

Automatic Sync

RFI and submittal data flows from Forma Build into SmartPM and keeps updating in the background. No exports, no re-keying, no parallel spreadsheet going stale.

Documented Accountability

Every RFI and submittal carries a full timeline of float erosion — response, due date, closeout, and how it lines up against the activity start. No more guessing who dropped the ball or how close it came to impacting the schedule — the timeline speaks for itself.

A Defensible Ask

Walk into any owner or trade conversation with the impact in hand: not "please answer this RFI," but "this one has four days of float and it lands on structural steel."
